Operations Management by B. Mahadevan. The book was originally published in 1997. 100% Money Back Guarantee If you find this book in other sites and wish to download the book, I recommend you to download the book from link provided at the top of the website. It will help you to save your time and efforts to download the book. I wish you to enjoy reading this book as well. This book is the pdf version of the original book published in 1997.Q: How to prevent some users from accessing some pages? I have two different pages in my app for users in "A" and "B" roles. If a user of "B" role accesses one of these pages I would like to have some kind of a "warning", for example, to remind the user that he has no access to this page. What is the best way to do this? Thank you. A: For a "warning" only, I'd suggest some Ajax instead of just showing the message. The way I'd do it is to create a new role, say "parent" and have all pages be in roles A and B except that one page in the root role, the one that is called by the Ajax call. You could dynamically add the parent role to the user instead of using the built in roles. Instead of having "A" and "B" roles in the database, I'd just have parent roles. The user would then be able to log in and navigate to a page at the root of the site, and then have a url that points to one of the pages, and that url would be called with Ajax. In your success callback, check if the user's role matches the url's role. If not, show the warning. Otherwise, process what you need. Another option is to use URLs like you'd use cookies, except you'd put your warning message in the url
